Center clone name: 516\_A\_8

\*\*\*\*\*  
\* NOTE: This record contains 88 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

# TITLE JOURNAL COMMENT

Young, G., Zainoun, J., Zimmer, A. and Zody, M.  
Direct Submission  
Submitted (05-APR-2000) Whitehead Institute/MIT Center for Genome  
Research, 320 Charles Street, Cambridge, MA 02141, USA  
All repeats were identified using RepeatMasker:  
Smit, A.P.A. & Green, P. (1996-1997)  
<http://ftp.genome.washington.edu/RM/RepeatMasker.html>  
----- Genome Center

----- Project Information  
Center project name: L5036  
Center clone name: 390\_D\_17  
-----  
\* NOTE: This record contains 89 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

3 (bases 1 to 421172)  
Rat Genome Sequencing Consortium.  
Direct Submission  
Submitted (11-OCT-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA  
On Oct 11, 2002 this sequence version replaced gi:21743603.  
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

TITLE  
JOURNAL  
COMMENT

\* NOTE: This record contains 166 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

\* 1 714: contig of 714 bp in length  
\* 715 814: gap of 100 bp  
\* 815 1518: contig of 704 bp in length  
\* 1519 1618: gap of 100 bp

 Center project name: KEOP  
 Center clone name: CH230-245G14  
 ----- Summary Statistics  
 Sequencing vector: Plasmid;  
 Chemistry: Dye-terminator Big Dye 100% of reads  
 Assembly program: Phrap; version 0.990329  
 Consensus quality: 128586 bases at least Q40  
 Consensus quality: 136602 bases at least Q30  
 Consensus quality: 142934 bases at least Q20  
 Estimated insert size: 13336; sum-of-coverage  
 Quality coverage: 2x in Q20 bases; sum-of-coverage estimation

NOTE: Estimated insert size may differ from sequence length  
 (see <http://www.hgsc.bcm.tmc.edu/docs/genbankdraft.data.html>).  
 NOTE: This is a "working draft" sequence. It currently consists of 53 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Sequencing vector: M3; 100%
Chemistry: Dye-terminator Big Dye; 0% of reads
Assembly program: Phrap; version 0.990319
Consensus quality: 145424 bases at least Q40
Consensus quality: 147251 bases at least Q30
Insert size: 14600; agarose-fp
Insert size: 149444; sum-of-contigs
Quality coverage: 5.22 in Q20 bases; agarose-fp
Quality coverage: 5.13 in Q20 bases; sum-of-contigs
-----
* NOTE: This is a 'working draft' sequence. It currently
* consists of 15 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

Quality coverage: 3.7 in Q20 bases; agarose-fp  
Quality coverage: 3.7 in Q20 bases; sum-of-contigs

NOTE: This is a 'working draft' sequence. It currently consists of 35 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence, as soon as it is available and the accession number will be preserved.

 Sequencing vector: M13; M77815; 100% of reads  
 Chemistry: Dye-terminator Big Dye; 100% of reads  
 Assembly program: Phrap; version 0.960731  
 Consensus quality: 150530 bases at least Q40  
 Consensus quality: 15616 bases at least Q30  
 Consensus quality: 158784 bases at least Q20  
 Insert size: 157000; agarose-fp  
 Insert size: 159929; sum-of-coverage  
 Quality coverage: 4.1 in Q20 bases; sum-of-coverage  
 Quality coverage: 4.1 in Q20 bases; sum-of-coverage  
 -----  
 \* NOTE: This is a 'working draft' sequence. It currently  
 \* consists of 20 contigs. The true order of the pieces  
 \* is not known and their order in this sequence record is  
 \* arbitrary. Gaps between the contigs are represented as  
 \* runs of N, but the exact sizes of the gaps are unknown.  
 \* This record will be updated with the finished sequence  
 \* as soon as it is available and the accession number will  
 \* be preserved.  
 1 1220: contig of 1220 bp in length  
 \* 1221 1320: gap of 100 bp  
 \* 1321 2400: contig of 1080 bp in length  
 \* 2401 2500: gap of 100 bp  
 \* 2501 4030: contig of 1530 bp in length  
 \* 4031 4130: gap of 100 bp

It currently consists of 11 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved. 1 6995: contig of 6995 bp in length 6996 7095: gap of 100 bp 7096 16711: contig of 9616 bp in length 16712 16811: gap of 100 bp 16812 35552: contig of 18741 bp in length 35553 35652: gap of 100 bp 35653 38371: contig of 2719 bp in length 38372 38471: gap of 100 bp 38472 64553: contig of 26082 bp in length 64554 64653: gap of 100 bp 64654 109139: contig of 44466 bp in length 109140 109238: gap of 100 bp 109239 113076: contig of 3837 bp in length 113077 113176: gap of 100 bp 113177 137707: contig of 24531 bp in length 137708 137807: gap of 100 bp 137808 152500: contig of 14663 bp in length 152501 152600: gap of 100 bp 152601 160231: contig of 7631 bp in length 160232 160331: gap of 100 bp

  Baylor Plaza, Houston, TX 77030, USA
  3 (bases 1 to 178472)
  Rat Genome Sequencing Consortium.
  Direct Submission
  Submitted (19-NOV-2002) Human Genome Sequencing Center, Department
  of Molecular and Human Genetics, Baylor College of Medicine, One
  Baylor Plaza, Houston, TX 77030, USA
  On Nov 19, 2002 this sequence version replaced gi:23196214.
  The sequence in this assembly is a combination of BAC based reads
  and whole genome shotgun sequencing reads assembled using Atlas
  (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
  in the feature table below represents a scaffold in the Atlas
  assembly (a 'contig-scaffold'). Within each contig-scaffold,
  individual sequence contigs are ordered and oriented, and separated
  by sized gaps filled with Ns to the estimated size. The sequence
  may extend beyond the ends of the clone and there may be sequence
  contigs within a contig-scaffold that consist entirely of whole
  genome shotgun sequence reads. Both end sequences and whole genome
  shotgun sequence only contigs will be indicated in the feature
  table.

              Insert size: 179723; 3.4% error; agarose-fp
              Quality coverage: 8.73x in Q20 bases; sum-of-ctrls Quality
              coverage: 9.09x in Q20 bases; agarose-fp

* NOTE: This is a 'working draft' sequence. It currently
* consists of 5 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.
*

Center clone name: 380L14

The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicated order and orientation of each sequence contig has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8X average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associated with a Phrap-derived quality score.

----- Summary Statistics -----

Sequencing Vector: plasmid; n/a; 100% of reads  
Chemistry: Dye-terminator Big Dye; 100% of reads  
Assembly program: Phrap; version 0.990319  
Consensus quality: 200278 bases at least Q40  
Consensus quality: 201061 bases at least Q30  
Consensus quality: 201319 bases at least Q20  
Insert size: 199000; agarose-fp  
Quality coverage: 11.29x in Q20 bases; sum-of-contigs  
Quality coverage: 11.16x in Q20 bases; sum-of-contigs

\* NOTE: This is a 'working draft' sequence. It currently consists of 11 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have been provided by the submitter.

\* This sequence will be replaced by the finished sequence as soon as it is available and by the finished sequence will be preserved.

1 491: contig of 491 bp in length  
\* 492 591: gap of unknown length

            On Nov 19, 2002 this sequence version replaced gi:22907669.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.

JOURNAL Submitted (10-MAY-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One

## COMMENT

Baylor Plaza, Houston, TX 77030, USA  
On May 10, 2003 this sequence version replaced gi:23269275.  
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

* NOTE: This is a 'working draft' sequence. It currently
* consists of 14 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

Direct Submission
Submitted (10-MAY-2003) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
On May 10, 2003 this sequence version replaced gi:24953991.
The sequence in this assembly is a combination of BAC based reads
and whole genome shotgun sequencing reads assembled using Atlas
(http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
in the feature table below represents a scaffold in the Atlas
assembly (a 'contig-scaffold'). Within each contig-scaffold,
individual sequence contigs are ordered and oriented, and separated
by sized gaps filled with Ns to the estimated size. The sequence
may extend beyond the ends of the clone and there may be sequence
contigs within a contig-scaffold that consist entirely of whole
genome shotgun sequence reads. Both end sequences and whole genome
shotgun sequence only contigs will be indicated in the feature
table.

3 (bases 1 to 224370)
Rat Genome Sequencing Consortium.
Direct Submission
Submitted (06-OCT-2001) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
On May 10, 2003 this sequence version replaced gi:25188677.
The sequence in this assembly is a combination of BAC based reads
and whole genome shotgun sequencing reads assembled using Atlas
(http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
in the feature table below represents a scaffold in the Atlas
assembly (a 'contig-scaffold'). Within each contig-scaffold,
individual sequence contigs are ordered and oriented, and separated
by sized gaps filled with Ns to the estimated size. The sequence
may extend beyond the ends of the clone and there may be sequence
contigs within a contig-scaffold that consist entirely of whole
genome shotgun sequence reads. Both end sequences and whole genome
shotgun sequence only contigs will be indicated in the feature
table.

----- Project Information -----
Center project name: G1DT
Center clone name: CH230-204423
----- Summary Statistics -----
Assembly program: AClas 3.0;
Consensus quality: 189343 bases at least Q40
Consensus quality: 194891 bases at least Q30
Consensus quality: 198424 bases at least Q20
Estimated insert size: 212744; sum-of-contigs estimation
Quality coverage: 5x in Q20 bases; sum-of-contigs estimation
-----
* NOTE: Estimated insert size may differ from sequence length
  (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html)
* NOTE: This is a "working draft" sequence. It currently
  consists of 9 contigs. The true order of the pieces
  is not known and their order in this sequence record is
  arbitrary. Gaps between the contigs are represented as
  runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
  as soon as it is available and the accession number will
  be preserved.

Rat Genome Sequencing Consortium.
Submitted (13-NOV-2002) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
On Nov 13, 2002 this sequence version replaced gi:23267838.
The sequence in this assembly is a combination of BAC based reads
and whole genome shotgun sequencing reads assembled using Atlas
(http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
in the feature table below represents a scaffold in the Atlas
assembly (a 'contig-scaffold'). Within each contig-scaffold,
individual sequence contigs are ordered and oriented, and separated
by sized gaps filled with Ns to the estimated size. The sequence
may extend beyond the ends of the clone and there may be sequence
contigs within a contig-scaffold that consist entirely of whole
genome shotgun sequence reads. Both end sequences and whole genome
shotgun sequence only contigs will be indicated in the feature
table.

            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
            On May 10, 2003 this sequence version replaced gi:24819714.
            The sequence in this assembly is a combination of BAC based reads
            and whole genome shotgun sequencing reads assembled using Atlas
            (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
            in the feature table below represents a scaffold in the Atlas
            assembly (a 'contig-scaffold'). Within each contig-scaffold,
            individual sequence contigs are ordered and oriented, and separated
            by sized gaps filled with Ns to the estimated size. The sequence
            may extend beyond the ends of the clone and there may be sequence
            contigs within a contig-scaffold that consist entirely of whole
            genome shotgun sequence reads. Both end sequences and whole genome
            shotgun sequence only contigs will be indicated in the feature
            table.

Rat Genome Sequencing Consortium.
Rat Genome Sequencing Consortium.
Submitted (26-SEP-2002) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
On Sep 26, 2002 this sequence version replaced gi:21903166.
The sequence in this assembly is a combination of BAC based reads
and whole genome shotgun sequencing reads assembled using Atilas
(http://www.hgsc.bcm.tmc.edu/projects/rat/). As a result, the
sequence may extend beyond the ends of the clone and there may be
contigs that consist entirely of whole genome shotgun sequence
reads. Both end sequences and whole genome shotgun sequence only

```

contigs will be indicated in the feature table.

 On May 9, 2003 this sequence version replaced gi:23265699.  
 The sequence in this assembly is a combination of BAC based reads  
 and whole genome shotgun sequencing reads assembled using Atlas  
 (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described  
 in the feature table below represents a scaffold in the Atlas  
 assembly (a 'contig-scaffold'). Within each contig-scaffold,  
 individual sequence contigs are ordered and oriented, and separated  
 by sized gaps filled with Ns to the estimated size. The sequence  
 may extend beyond the ends of the clone and there may be sequence  
 contigs within a contig-scaffold that consist entirely of whole  
 genome shotgun sequence reads. Both end sequences and whole genome  
 shotgun sequence only contigs will be indicated in the feature  
 table.

Submitted (10-MAY-2003) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA
On May 10, 2003 this sequence version replaced gi:24818075.
The sequence in this assembly is a combination of BAC based reads
and whole genome shotgun sequencing reads assembled using Atlas
(http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
in the feature table below represents a scaffold in the Atlas
assembly (a 'contig-scaffold'). Within each contig-scaffold,
individual sequence contigs are ordered and oriented, and separated
by sized gaps filled with Ns to the estimated size. The sequence
may extend beyond the ends of the clone and there may be sequence
contigs within a contig-scaffold that consist entirely of whole
genome shotgun sequence reads. Both end sequences and whole genome
shotgun sequence only contigs will be indicated in the feature
table.

On Nov 19, 2002 this sequence version replaced gi:23196153.  
The sequence in this assembly is a combination of BAC based reads  
and whole genome shotgun sequencing reads assembled using Atlas  
(<http://www.hgsc.bcm.tmc.edu/Projects/rat/>). Each contig described  
in the feature table below represents a scaffold in the Atlas  
assembly (a 'contig-scaffold'). Within each contig-scaffold,  
individual sequence contigs are ordered and oriented, and separated  
by sized gaps filled with Ns to the estimated size. The sequence  
may extend beyond the ends of the clone and there may be sequence  
contigs within a contig-scaffold that consist entirely of whole  
genome shotgun sequence reads. Both end sequences and whole genome  
shotgun sequence only contigs will be indicated in the feature  
table.

  On Sep 21, 2002 this sequence version replaced gi:212733901.
  The sequence in this assembly is a combination of BAC based reads
  and whole genome shotgun sequencing reads assembled using Atlas
  (http://www.hgsc.bcm.tmc.edu/projects/rat/). As a result, the
  sequence may extend beyond the ends of the clone and there may be
  contigs that consist entirely of whole genome shotgun sequence
  reads. Both end sequences and whole genome shotgun sequence only
  contigs will be indicated in the feature table.

On May 9, 2003 this sequence version replaced gi:24818166.
The sequence in this assembly is a combination of BAC based reads
and whole genome shotgun sequencing reads assembled using Atlas
(http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described
in the feature table below represents a scaffold in the Atlas
assembly (a 'contig-scaffold'). Within each contig-scaffold,
individual sequence contigs are ordered and oriented, and separated
by sized gaps filled with Ns to the estimated size. The sequence
may extend beyond the ends of the clone and there may be sequence
contigs within a contig-scaffold that consist entirely of whole
genome shotgun sequence reads. Both end sequences and whole genome
shotgun sequence only contigs will be indicated in the feature
table.

Rat Genome Sequencing Consortium.  
Submitted (10-MAY-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA  
On May 10, 2003 this sequence version replaced gi:23096370.  
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome

shotgun sequence only contigs will be indicated in the feature table.

-----  
\* NOTE: This record contains 33 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

## COMMENT

```

On Aug 3, 1998 this sequence version replaced gi:166615.
IMPORTANT: This sequence is unfinished and does not necessarily
represent the correct sequence. Work on the sequence is in progress
and the release of this data is based on the understanding that the
sequence may change as work continues. The sequence may be
contaminated with foreign sequence from E.coli, yeast, vector,
phage etc. Order of segments is not known; 800 n's separate
segments.
* NOTE: This is a 'working draft' sequence. It currently
* consists of 15 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

```

```

```

* NOTE: This record contains 71 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will

```

\* be preserved.

-----  
\* NOTE: This record contains 74 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlaid relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

Center clone name: 77\_A\_24

NOTE: This record contains 73 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

\* NOTE: This is a 'working draft' sequence. It currently  
 \* consists of 25 contigs. The true order of the pieces  
 \* is not known and their order in this sequence record is  
 \* arbitrary. Gaps between the contigs are represented as  
 \* runs of 'N', but the exact sizes of the gaps are unknown.  
 \* This record will be updated with the finished sequence  
 \* as soon as it is available and the accession number will  
 \* be preserved.

Center clone name: 94\_F\_15

\* NOTE: This record contains 76 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

Center project name: L15577
Center clone name: 17_C_18

```

```

* NOTE: This record contains 79 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.

```

\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

Center clone name: 136\_M\_7

NOTE: This record contains 81 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

## COMMENT

Viel.R., Vo.A., Wilson.B., Wu.X., Wyman.D., Ye.W.J., Young.G.,  
Zainoun.J., Zemek.L., Zimmer.A. and Zody.M.  
Direct Submission  
Submitted (06-MAY-2002) Whitehead Institute/MIT Center for Genome  
Research, 320 Charles Street, Cambridge, MA 02141, USA  
All repeats were identified using RepeatMasker:  
Smit, A.F.A. & Green, P. (1996-1997)  
<http://ftp.genome.washington.edu/RM/RepeatMasker.html>

Project Information  
Project name: L26045  
Center project name: 542\_F\_4

\* NOTE: This record contains 81 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

\* NOTE: This record contains 82 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

-----  
\* NOTE: This record contains 90 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

Direct Submission  
Submitted (14-FEB-2000) Whitehead Institute/MIT Center for Genome  
Research, 320 Charles Street, Cambridge, MA 02141, USA  
On Jul 13, 2000 this sequence version replaced gi:6970673.  
All repeats were identified using RepeatMasker:  
Smit,A.F.A. & Green,P. (1996-1997)  
<http://ftp.genome.washington.edu/RM/RepeatMasker.html>

Genome Center

Contact: sequence.submissions@genome.wi.mit.edu

----- Project Information -----  
Center project name: L6552  
Center clone name: 734\_K\_12

\* NOTE: This record contains 79 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

Direct Submission
TITLE Submitted (16-JAN-2000) Whitehead Institute/MIT Center for Genome
JOURNAL Research, 320 Charles Street, Cambridge, MA 02141, USA
COMMENT All repeats were identified using RepeatMasker:
Smit, A.F.A. & Green, P. (1996-1997)
http://ftp.genome.washington.edu/RM/RepeatMasker.html

----- Project Information
Center project name: 15513
Center clone name: 351_F_2

* NOTE: This record contains 79 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.

Direct Submission
Unpublished
2 (bases 1 to 99630)
Submitted (21-MAR-2003) Human Genome Sequencing Center, Department
of Molecular and Human Genetics, Baylor College of Medicine, One
Baylor Plaza, Houston, TX 77030, USA

----- Genome Center
Center: Baylor College of Medicine
Center code: BCM
Web site: http://www.hgsc.bcm.tmc.edu/
Contact: hgsc-help@bcm.tmc.edu
----- Project Information
Center project name: GM02
Center clone name: CH230-21H3
----- Summary Statistics
Sequencing vector: Plasmid
Chemistry: Dye-terminator Big Dye 100% of reads
Assembly program: Phrap; version 0.990329
Consensus quality: 69017 bases at least Q40
Consensus quality: 78942 bases at least Q30
Consensus quality: 85937 bases at least Q20
Estimated insert size: 76134; sum-of-contigs estimation
Quality coverage: 1x in Q20 bases; sum-of-contigs estimation

-----
* NOTE: Estimated insert size may differ from sequence length
* (see http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html).
* NOTE: This is a 'working draft' sequence. It currently
* consists of 50 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

3 (bases 1 to 519219)  
Worley, K.C.  
Submitted (26-SEP-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA  
On Sep 26, 2002 this sequence version replaced gi:13661933.  
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). As a result, the sequence may extend beyond the ends of the clone and there may be contigs that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

----- Project Information  
 Center project name: HAVU  
 Center clone name: RP11-98J5  
 Sequencing vector: M13; L08821  
 Chemistry: Dye-terminator Big Dye 738 of reads  
 Assembly program: Phrap; version 0.990329First call to  
 findPhrapList

Consensus quality: 369571 bases at least Q40  
 Consensus quality: 395345 bases at least Q30  
 Consensus quality: 411294 bases at least Q20  
 Estimated insert size: 393000; sum-of-contigs estimation  
 Quality coverage: 0x in Q20 bases; agarose-tp estimation  
 Quality coverage: 4.4x in Q20 bases; sum-of-contigs estimation

\* NOTE: Estimated insert size may differ from sequence length  
 \* (see [http://www.hgsc.bcm.tmc.edu/docs/Genbank\\_draft\\_data.html](http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html))  
 \* NOTE: This sequence may represent more than one clone.  
 \* NOTE: This is a 'working draft' sequence. It currently

\* consists of 101 contigs. The true order of the pieces  
 \* is not known and their order in this sequence record is  
 \* arbitrary. Gaps between the contigs are represented as  
 \* runs of N, but the exact sizes of the gaps are unknown.  
 \* This record will be updated with the finished sequence  
 \* as soon as it is available and the accession number will  
 \* be preserved.

\* NOTE: This record contains 125 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

# COMMENT

----- Summary Statistics -----  
Sequencing vector: plasmid, 108752; 100% of reads  
Chemistry: Dye-terminator Big Dye; 100% of reads  
Consensus quality: 122442 bases at least Q40  
Consensus quality: 126008 bases at least Q30  
Consensus quality: 128093 bases at least Q20  
Insert size: 130600; sum-of-contigs  
Quality coverage: 3.42x in Q20 bases; sum-of-contigs Quality  
coverage: 3.13x in Q20 bases; agarose-fp  
-----

\* NOTE: This is a 'working draft' sequence. It currently  
\* consists of 21 contigs. The true order of the pieces  
\* is not known and their order in this sequence record is  
\* arbitrary. Gaps between the contigs are represented as  
\* runs of N, but the exact sizes of the gaps are unknown.  
\* This record will be updated with the finished sequence  
\* as soon as it is available and the accession number will  
\* be preserved.

Project Information

Center project name: L18567

Center clone name: 22\_C\_8

NOTE: This record contains 162 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

            Direct Submission
            Submitted (16-JUN-1999) Drosophila Genome Center, Lawrence Berkeley
            Laboratory, MS 64-121, Berkeley, CA 94720, USA
            On Dec 21, 1999 this sequence version replaced gi:5554231.
            For further information about this sequence, including its location
            and relationship to other sequences, please visit our sequence
            archive Web site (http://www.fruitfly.org/sequence/) or send email
            to bugreport@fruitfly.berkeley.edu. All contigs in this submission meet
            the following cutoffs: length >= 200 bases.
            NOTE: This is a 'working draft' sequence. It currently
            * consists of 95 contigs. The true order of the pieces
            * is not known and their order in this sequence record is
            * arbitrary. Gaps between the contigs are represented as
            * runs of N, but the exact sizes of the gaps are unknown.
            * This record will be updated with the finished sequence
            * as soon as it is available and the accession number will
            * be preserved.

\* NOTE: This is a 'working draft' sequence. It currently  
\* consists of 118 contigs. The true order of the pieces  
\* is not known and their order in this sequence record is  
\* arbitrary. Gaps between the contigs are represented as  
\* runs of N, but the exact sizes of the gaps are unknown.

\* This record will be updated with the finished sequence  
\* as soon as it is available and the accession number will  
\* be preserved.

Project Information

Center project name: KEIG  
Center clone name: CH230-341123

Summary Statistics

Sequencing vector: Plasmid;  
Chemistry: Dye-terminator Big Dye; 100% of reads  
Assembly program: Phrap; version 0.990329  
Consensus quality: 137103 bases at least Q40  
Consensus quality: 138905 bases at least Q30  
Consensus quality: 140423 bases at least Q20  
Estimated insert size: 138648; sum-of-contigs estimation  
Quality coverage: 5x in Q20 bases; sum-of-contigs estimation

NOTE: Estimated insert size may differ from sequence length  
(see [http://www.hgsc.bcm.tmc.edu/docs/Genbankdraft\\_data.html](http://www.hgsc.bcm.tmc.edu/docs/Genbankdraft_data.html)).  
NOTE: This is a "working draft" sequence. It currently  
consists of 20 contigs. The true order of the pieces  
is not known and their order in this sequence record is  
arbitrary. Gaps between the contigs are represented as  
runs of N, but the exact sizes of the gaps are unknown.  
This record will be updated with the finished sequence  
as soon as it is available and the accession number will  
be preserved.

1	1071: contig of 1071 bp in length

## ----- Genome Center

Center: Baylor College of Medicine

Center code: BCM

Web site: <http://www.hgsc.bcm.tmc.edu/>

Contact: hgsc-help@bcm.tmc.edu

Project Information

Center project name: KEJ1

Center clone name: CH230-43516

----- Summary Statistics

Sequencing vector: Plasmid

Chemistry: Dye-terminator Big Dye 100% of reads

Assembly program: Phrap; version 0.990329

Consensus quality: 122876 bases at least Q40

Consensus quality: 127474 bases at least Q30

Consensus quality: 131284 bases at least Q20

Estimated insert size: 121255; sum-of-contigs estimation

Quality coverage: 3x in Q20 bases; sum-of-contigs estimation

\* NOTE: Estimated insert size may differ from sequence length  
(see [http://www.hgsc.bcm.tmc.edu/docs/genbank\\_draft\\_data.html](http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html)).  
\* NOTE: This is a 'working draft' sequence. It currently  
\* consists of 62 contigs. The true order of the pieces  
\* is not known and their order in this sequence record is  
\* arbitrary. Gaps between the contigs are represented as  
\* runs of N, but the exact sizes of the gaps are unknown.  
\* This record will be updated with the finished sequence  
\* as soon as it is available and the accession number will  
\* be preserved.

Summary Statistics  
Chemistry: Dye-terminator Big Dye; inf% of reads  
Consensus quality: 5823 bases at least Q40  
Consensus quality: 6614 bases at least Q30  
Consensus quality: 7584 bases at least Q20  
-----  
\* NOTE: Estimated insert size may differ from sequence length  
\* (see [http://www.hgsc.bcm.tmc.edu/docs/genbank\\_draft\\_data.html](http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html))  
\* NOTE: The contigs are based on the application  
\* of the PGI method using the human genome (NCBI build 31)  
\* as the comparative genome.  
\* NOTE: This is a 'working draft' sequence. It currently  
\* consists of 1 contigs. Gaps between the contigs  
\* are represented as runs of N. The order of the pieces  
\* is believed to be correct as given, however the sizes  
\* of the gaps between them are based on estimates that have  
\* provided by the submitter.  
\* This sequence will be replaced  
\* by the finished sequence as soon as it is available and  
\* the accession number will be preserved.  
\* 1 145555: contig of 145555 bp in length.

----- Project Information

Center project name: L2687

Center clone name: 2\_O\_24

NOTE: This record contains 148 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.  
\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

    Assembly program: Phrap; version 0.990329
    Consensus quality: 140432 bases at least Q40
    Consensus quality: 143346 bases at least Q30
    Consensus quality: 145310 bases at least Q20
    Estimated insert size: 145510; sum-of-contigs estimation
    Quality coverage: 5x in Q20 bases; sum-of-contigs estimation

```

```

* NOTE: Estimated insert size may differ from sequence length
* (see http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html).
* NOTE: This is a working draft sequence. It currently
* consists of 19 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

COMMENT
Groveomont Circle, Gaithersburg, MD 20877, USA
On May 23, 2002 this sequence version replaced gi:14327785.
----- Genome Center
Center: NIH Intramural Sequencing Center
Center code: NISC
Web site: http://www.nisc.nih.gov
Contact: nisc.zoo@nih.gov
----- Project Information
Center project name: ctd
Center clone name: 145H12

The sequence data in this record represents an 'enhanced'
version of a Phase 2 submission. Specifically, the indicated
order and orientation of each sequence contig has been
established using one or more of the following: read-pair
data from individual subclones, overlaps with neighboring
clones, alignment with available reference sequence (e.g.,
human), and/or confirmation by PCR testing. In addition,
the sequence assembly is based on at least 8X average
coverage in Q20 bases and has been reviewed to rule out
gross misassemblies, the low-quality ends of sequence
contigs have been trimmed away, and each base is associated
with a Phrap-derived quality score.
----- Summary Statistics
Sequencing vector: plasmid; n/a; 100% of reads
Chemistry: Dye-terminator Big Dye 100% of reads
Assembly program: Phrap; version 0.990319
Consensus quality: 149914 bases at least Q40
Consensus quality: 150239 bases at least Q30
Consensus quality: 150421 bases at least Q20
Insert size: 130000; agarose-fp
Insert size: 150567; sum-of-contigs
Quality coverage: 13.36x in Q20 bases; agarose-fp
Quality coverage: 11.53x in Q20 bases; sum-of-contigs
-----
* NOTE: This is a 'working draft' sequence. It currently
* consists of 5 contigs. Gaps between the contigs
* are represented as runs of N. The order of the pieces
* is believed to be correct as given, however the sizes
* of the gaps between them are based on estimates that have
* provided by the submitter.
* This sequence will be replaced
* by the finished sequence as soon as it is available and
* the accession number will be preserved.
*
* 1 25568: contig of 25568 bp in length
* 25569 25668: gap of unknown length
* 25669 36116: contig of 10448 bp in length
* 36117 104093: gap of unknown length
* 36217 104093: contig of 67877 bp in length
* 104094 104193: gap of unknown length
* 104194 142495: contig of 38302 bp in length
* 142496 142595: gap of unknown length
* 142596 150967: contig of 8372 bp in length.

Contact: hgsc-help.tmc.edu
Project Information
Center project name: FBGY
Center clone name: CH240-312P22
----- Summary Statistics
Sequencing vector: Plasmid
Chemistry: Dye-terminator Big Dye 100% of reads
Assembly program: Phrap; version 0.990329
Consensus quality: 152191 bases at least Q40
Consensus quality: 155092 bases at least Q30
Consensus quality: 158513 bases at least Q20
Estimated insert size: 162494, sum-of-contigs estimation
Quality coverage: 3x in Q20 bases; agarose-fp estimation
Quality coverage: 3x in Q20 bases; sum-of-contigs estimation
-----
* NOTE: Estimated insert size may differ from sequence length
* (see http://www.hgsc.bcm.tmc.edu/docs/genbank_draft_data.html).
* NOTE: This is a 'working draft' sequence. It currently
* consists of 16 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

Center clone name: 24\_B\_21

\*\*\*\*\* NOTE: This record contains 167 individual  
\* sequencing reads that have not been assembled into  
\* contigs. Runs of N are used to separate the reads  
\* and the order in which they appear is completely  
\* arbitrary. Low-pass sequence sampling is useful for  
\* identifying clones that may be gene-rich and allows  
\* overlap relationships among clones to be deduced.

\* However, it should not be assumed that this clone  
\* will be sequenced to completion. In the event that  
\* the record is updated, the accession number will  
\* be preserved.

## JOURNAL

Submitted (10-AUG-2004) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA  
3 (bases 1 to 153541)  
Worley, K.C.

## REFERENCE

Submitted (14-SEP-2004) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA  
On Sep 14, 2004 this sequence version replaced gi:51172638.

## COMMENT

Center: Baylor College of Medicine

Center code: BCM

Web site: <http://www.hgsc.bcm.tmc.edu/>

Contact: hgsc-help.tmc.edu

Project Information

Center project name: FBXK

Center clone name: CH240-397L15

Summary Statistics

Sequencing vector: Plasmid;

Chemistry: Dye-terminator Big Dye; 100% of reads

Assembly program: Phrap; version 0.990329

Consensus quality: 163292 bases at least Q40

Consensus quality: 163699 bases at least Q30

Estimated insert size: 163519; sum-of-contigs estimation

Quality coverage: 15x in Q20 bases; sum-of-contigs estimation

-----  
\* NOTE: Estimated insert size may differ from sequence length  
\* (see [http://www.hgsc.bcm.tmc.edu/docs/genbankdraft\\_data.html](http://www.hgsc.bcm.tmc.edu/docs/genbankdraft_data.html))  
\* The sequence data in this record represents an 'enhanced' version  
\* of a Phase 2 submission. The indicated order and orientation of  
\* each sequence has been established using one or more of the  
\* following: read-pair data from individual subclones, overlaps  
\* with neighboring clones, alignment with available reference  
\* sequence (e.g., human), and/or confirmation by PCR testing.  
\* NOTE: This is a 'working draft' sequence. It currently  
\* consists of 3 contigs. Gaps between the contigs  
\* are represented as runs of N. The order of the pieces  
\* is believed to be correct as given, however the sizes  
\* of the gaps between them are based on estimates that have  
\* been provided by the submitter.  
\* This sequence will be replaced  
\* by the finished sequence as soon as it is available and  
\* the accession number will be preserved.  
\* 1 81569: contig of 81569 bp in length  
\* 81570 81619: gap of 50 bp  
\* 81620 132377: contig of 50758 bp in length  
\* 132378 132577: gap of 200 bp  
\* 132578 153541: contig of 20964 bp in length.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

XX

PS Claim 22; Page 10; 74pp; English.

CC The invention describes synthetic oligonucleotides complementary to a

CC portion of the 5' untranslated region of hepatitis C virus. The

CC oligonucleotides may be used in methods for controlling, preventing, and

CC treating hepatitis C virus infection, in antisense technology and gene

CC therapy, and of detecting the presence of hepatitis C virus in a sample.  
 CC Hepatitis C virus (HCV) is an enveloped, positive sense, single-stranded  
 CC RNA virus which infects hepatocytes. HCV is the major cause of non-A, non  
 CC -B, acute and chronic hepatitis, and has been associated with  
 CC hepatocellular carcinoma. The invention describes methods and kits for  
 CC inhibiting replication of HCV, inhibiting the expression of HCV nucleic  
 CC acid and protein, and for treating HCV infections. This sequence  
 CC represents a synthetic DNA-RNA hybrid oligonucleotide used for inhibiting  
 CC HCV replication and expression of HCV

 XX  
 CC The invention relates to a method for obtaining a single stranded  
 CC polynucleotide tag from a double stranded sample by cleaving one of the  
 CC complementary strands of a double stranded polynucleotide with a cleavage  
 CC agent capable of recognizing a double stranded polynucleotide comprising  
 CC complementary strands and cleaving only one of the strands of the  
 CC polynucleotide in the process of generating a single stranded  
 CC polynucleotide tag. The method is useful for separating, analyzing,  
 CC quantifying or obtaining single stranded polynucleotides comprising tags  
 CC originating partly, and preferably wholly from a source of DNA and/or RNA  
 CC in a sample comprising biological cells. The method is particularly for  
 CC analyzing gene expression (expression profiling or differential gene  
 CC expression), or in diagnosing clinical conditions. The present sequence  
 CC is an adapter oligonucleotide used to illustrate the method of the  
 CC invention

 PS Example 2; Page 114-115; 115pp; English.  
 XX  
 CC The invention relates to single nucleotide polymorphisms in the gene  
 CC encoding the human caspase 5, apoptosis-related cysteine protease (CASP5)  
 CC polypeptide. A method for haplotyping the CASP5 gene in an individual  
 CC comprises identifying the nucleotide at one or more polymorphic sites and  
 CC determining whether one of the copies of the gene is defined by one of  
 CC the CASP5 haplotypes given in the specification or whether both copies  
 CC are defined by a haplotype pair. This method is useful in genotyping,  
 CC whereby all possible haplotype pairs can be assigned to specific  
 CC genotypes. An association between a trait and a haplotype or haplotype  
 CC pair of the CASP5 gene can be identified by comparing the frequency of  
 CC the haplotype or haplotype pair in a population exhibiting the trait with  
 CC the frequency of the haplotype or haplotype pair in a reference  
 CC population, where a higher haplotype frequency in the trait population  
 CC indicates the trait is associated with the haplotype or haplotype pair.  
 CC CASP5 and its corresponding DNA are used for studying the expression and  
 CC function of CASP5, for use in screening for candidate drugs to treat  
 CC diseases related to CASP5 activity, such as cancer (e.g. hereditary  
 CC nonpolyposis colorectal cancer, gastrointestinal tumours and endometrial  
 CC tumours). This sequence represents genomic DNA modified to facilitate  
 CC electronic searching of the CASP5 haplotypes

PT New isolated nucleic acid molecule, useful for drug screening and toxicity assays or for assessing the impact, including toxicity, of a compound, pharmaceutical agent or environmental pollutant on a cell or living organism.

PS Claim 1; SEQ ID NO 6655; 41pp; English

This invention is related to a novel isolated canine nucleic acid sequences and the construction of canine microarrays containing a significant portion of the canine genome. The isolated canine nucleic acid sequences of the invention may be useful for drug screening and toxicity assays. The invention is therefore useful for assessing the impact, including toxicity, of a compound, pharmaceutical agent or environmental pollutant on a cell or living organism. The methods are useful for detecting genes that are up- or down-regulated in canines in a disease state. The sequences are useful as diagnostic agents or markers to detect a cellular response in a sample individually or as part of a gene expression profile. It is also useful as a target for agents that modulate gene expression or activity. The database is useful for producing electronic Northern blots that allow the user to determine the cell type or tissue in which a given gene is expressed and to allow determination of the abundance or expression level of a given gene in a particular tissue or cell. The methods are useful for determining the similarity of a toxic response to one or more individual compounds. The methods are useful for predicting at least one toxic response or the likelihood that a compound or test agent will induce various specific pathologies such as those of the liver (liver necrosis, fatty liver disease, protein adduct formation or hepatitis), those of the kidney, heart, brain or testes, or other pathologies associated with at least one of the toxins. The methods are also useful for predicting or elucidating the potential cellular pathways influenced, induced or modulated by the compound or test agent due to the similarity of the expression profile compared to the profile induced by a known toxin. The present sequence is that of a canine DNA sequence which was claimed for use during the production of a canine microarray of the invention.

PT New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

PS Claim 1; SEQ ID NO 11805; 103pp; English.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. MS64197-MS64564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPAC at [http://wipac.int/pub/publibded\\_pct\\_sequences](http://wipac.int/pub/publibded_pct_sequences)

XX Nucleic acids originating in gene expressed in human neuroblastoma,  
PT useful as probe or primer in diagnosing prognosis of human neuroblastoma,  
PT malignancy and susceptibility indicator or tumor marker for anti-cancer  
PT agents.

XX Claim 1; Page 2664; 2979pp; Japanese.

XX The invention relates to novel genes (AA193926-AA197963) expressed in  
CC human neuroblastoma. The nucleic acids are applicable as a probe or  
CC primer in diagnosing the prognosis of human neuroblastoma, malignancy and  
CC susceptibility indicators or tumour markers for anti-cancer agents. The  
CC gene information for diagnosing prognosis is related to factors similar  
CC to that for N-myc and TrkA genes

XX (PROT-) PROTEIN DESIGN LABS INC.

XX Aziz N, Ginsburg WM, Zlotnik A;

XX WPI; 2004-441208/41.

XX Early detection of soft tissue sarcoma comprises determining expression  
PT of a gene in a first soft tissue sample and a normal soft tissue sample  
PT and comparing the gene expression, also useful in treating soft tissue  
PT sarcoma.

XX Example 2; SEQ ID NO 5790; 210pp; English.

XX The invention relates to a novel method for detecting soft tissue sarcoma  
CC which comprises obtaining a first soft tissue sample from an individual  
CC and a normal soft tissue sample from the same or different individual,  
CC determining the expression of a gene in both samples and comparing the  
CC expression of the gene in both soft tissue samples, where a higher level  
CC of protein expression in the first soft tissue sample indicates the  
CC presence of soft tissue sarcoma. The method of the invention has  
CC cytostatic applications and may be useful for detecting soft tissue  
CC sarcoma, possibly via gene therapy or vaccine production. The nucleic  
CC acid sequences may be useful in diagnostic and screening applications.  
CC The current sequence is that of a human soft tissue sarcoma-upregulated  
CC DNA of the invention. The current sequence is not shown within the  
CC specification per se but was submitted in CD format by the inventor.

 PT New recombinant nucleic acid encoding carcinoma associated protein,  
 PT useful for preparing compositions for treating carcinomas.  
 XX  
 XX Claim 1; SEQ ID NO 1445; 245bp; English.  
 XX

CC The invention relates to recombinant carcinoma associated (CA) nucleic  
 CC acid sequences from mouse and human (ADA01482-ADA03094), and to  
 CC recombinant carcinoma associated proteins (CAP) encoded by them. The  
 CC invention also encompasses expression vectors and host cells comprising a  
 CC CA nucleic acid, a polypeptide (especially an antibody) that specifically  
 CC binds to the protein, and a biochip comprising CA nucleic acid or  
 CC fragments thereof. The sequences of the invention were identified using  
 CC oncogenic retroviruses, which insert into the genome of the host organism  
 CC at random. Many of these do not carry transduced host oncogenes or  
 CC pathogenic trans-acting viral genes, meaning that cancer incidence is a  
 CC direct consequence of the effects of proviral integration into host  
 CC protooncogenes. The CA nucleic acid sequences can be used to diagnose  
 CC carcinoma (especially breast cancer, prostate cancer, lymphoma or  
 CC leukaemia) or a propensity to carcinoma by determination of the sequence  
 CC of a CA gene, or by determination of CA gene expression in particular  
 CC tissues. CA nucleic acids, proteins and antibodies are also useful as  
 CC therapeutic agents and in screening and evaluating drug candidates. The  
 CC present sequence represents a specifically claimed murine CA nucleic acid  
 CC sequence of the invention. Note: The complete sequence data for this  
 CC patent did not form part of the printed specification, but was obtained  
 CC in electronic format directly from WIPO at  
 CC ftp.wipo.int/pub/published\_pct\_sequences.

PT New recombinant nucleic acid comprising a nucleotide sequence of any of  
the carcinoma-associated (CA) genes, useful for screening for drug  
PT candidates for diagnosing or treating carcinomas.

PS Claim 1; SEQ ID NO 193; 983pp; English.

CC The invention relates to a recombinant nucleic acid comprising a  
CC nucleotide sequence selected from any of the fully defined carcinoma-  
CC associated (CA) genes from the 50 tables given in the specification. The  
CC CA proteins are secreted, transmembrane or intracellular proteins. The  
CC recombinant nucleic acids are useful for screening for drug candidates  
CC for diagnosing or treating carcinomas. Sequences given in ADC85215-  
CC ADC85514 represent CA genes of the invention.

PT New carcinoma associated gene or protein, useful for preparing a  
composition for diagnosing or treating carcinoma e.g., leukemia or  
PT lymphoma.

PS Claim 1; SEQ ID NO 193; 29pp; English.

CC The invention relates to new recombinant nucleic acids. The invention  
CC also relates to a host cell comprising a recombinant nucleic acid or  
CC expression vector, an expression vector comprising a recombinant nucleic  
CC acid, a recombinant protein, a method of screening for drug candidates, a  
CC method of screening for a bioactive agent capable of binding to a  
CC carcinoma associated protein (CAP) encoded by a nucleotide sequence, a  
CC method of screening for a bioactive agent capable of modulating the  
CC activity of a CAP, a method of evaluating the effect of a candidate  
CC carcinoma drug, a method of diagnosing carcinoma, a method for inhibiting  
CC the activity of a CAP, a method of treating carcinomas, a method of  
CC neutralising the effect of a CAP and a method of diagnosing carcinoma or  
CC propensity to carcinoma. A method of evaluating the effect of a candidate  
CC carcinoma drug comprises administering the drug to a patient, removing a  
CC cell sample from the patient and determining alterations in the  
CC expression or activation of a gene comprising the nucleotide sequence. A  
CC method of diagnosing carcinoma comprises determining the expression of  
CC one or more genes comprising the nucleic acid sequence in a first tissue  
CC type of a first individual and comparing the expression of the gene from  
CC a second normal tissue type from the first individual or a second  
CC unaffected individual, where a difference in the expression indicates  
CC that the first individual has carcinoma. A method of inhibiting the  
CC activity of a CAP comprises binding an inhibitor to the CAP. Treating  
CC carcinomas comprises administering to a patient an inhibitor of CAP.  
CC Neutralising the effect of a CAP comprises contacting an agent specific  
CC for the CAP. The polypeptide specifically binds to the protein encoded by  
CC the nucleic acid. It comprises an antibody that specifically binds to the  
CC protein encoded by the nucleic acid. The nucleic acids are useful for  
CC preparing a composition for diagnosing or treating carcinoma e.g.,  
CC leukemia or lymphoma. This sequence represents a murine carcinoma  
CC associated (CA) nucleic acid of the invention. Note: The sequence data  
CC for this patent did not form part of the printed specification but was  
CC obtained in electronic format directly from USPTO at  
CC segdata.uspto.gov/sequence.html.  
XX

Sequence 92726 BP; 23819 A; 19174 C; 20109 G; 27030 T; 0 U; 2594 Other;

CC and sensitive, reproducible and quantitative detection of one or more  
CC nucleic acids (single or double stranded). The design of primers and  
CC probes is sufficiently flexible to allow many nucleic acids to be  
CC detected in a standardized reaction format using partly the same primers  
CC and probes. Only small amplicons are produced (requiring short  
CC amplification cycles), there is no competition/displacement between the  
CC short counter-strand of the amplicon and the detection probe, and  
CC specificity is high because the relative proportion of the internal  
CC detection region is increased with respect to the total amplicon length,  
CC allowing better differentiation between (viral) subtypes. Also short  
CC amplicons are less likely to undergo non-specific hybridization, so  
CC background is low, and short RNA sequences are more stable, with reduced  
CC tendency to form secondary structures. AAX23968-69 and AAX24035-37 are  
CC PCR primers and probes used in the method of the invention

PT Synthetic oligonucleotides complementary to a portion of the 5'  
PT untranslated region of hepatitis C virus (HCV), useful for diagnosing and  
PT treating HCV infections and hepatocellular carcinoma.

XX  
PS Claim 1; Page 61; 74pp; English.

XX  
CC The invention describes synthetic oligonucleotides complementary to a

CC portion of the 5' untranslated region of hepatitis C virus. The  
CC oligonucleotides may be used in methods for controlling, preventing, and  
CC treating hepatitis C virus infection, in antisense technology and gene  
CC therapy, and of detecting the presence of hepatitis C virus in a sample.  
CC Hepatitis C virus (HCV) is an enveloped, positive sense, single-stranded  
CC RNA virus which infects hepatocytes. HCV is the major cause of non-A, non  
CC -B, acute and chronic hepatitis, and has been associated with  
CC hepatocellular carcinoma. The invention describes methods and kits for  
CC inhibiting replication of HCV, inhibiting the expression of HCV nucleic  
CC acid and protein, and for treating HCV infections. This sequence  
CC represents a synthetic oligonucleotide used for inhibiting HCV  
CC replication and expression of HCV

 PT New ribozymes targeting RNA derived from hepatitis C virus inhibit viral  
 PT replication and are useful to treat hepatitis C virus infections and  
 PT cirrhosis, liver failure or hepatocellular carcinoma.  
 XX  
 PS Disclosure; SEQ ID NO 1587; 80pp; English.  
 XX  
 CC The present invention relates to enzymatic nucleic acids which  
 CC specifically cleave RNA derived from Hepatitis C virus (HCV). The  
 CC enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin  
 CC (HP) motif where the binding arms comprise sequences complementary to one  
 CC of the substrate sequences defined in the specification. The HCV  
 CC ribozymes are useful for modulating the expression and/or replication of  
 CC HCV. They can be used to treat cirrhosis, liver failure and/or  
 CC hepatocellular carcinoma. The HCV ribozymes are also useful for treating  
 CC a condition associated with HCV infection in conjunction with one or more  
 CC other drug therapies, particularly type I interferon, especially  
 CC interferon alpha, beta or gamma or consensus interferon. The present  
 CC sequence represents a RNA sequence of unknown function. Note: The present  
 CC sequence is given in the sequence data but is not mentioned elsewhere in  
 CC the specification. The complete sequence data for this patent was  
 CC obtained in electronic format directly from the USPTO web site at  
 CC seqdata.uspto.gov/psipdIDentry.html

XX Ribozyme capable of inhibiting replication, infectivity or gene

XX expression of hepatitis C virus, useful for treating or preventing

XX hepatitis C virus infection.

XX Claim 1; Col 13; 57pp; English.

XX The present invention describes ribozymes (I) capable of inhibiting

XX replication, infectivity or gene expression of a hepatitis C virus (HCV),

XX directed to target sequences AAA13438 to AAA13444, AAA13454 and AAA13465.

XX (I) have virucide, hepatotropic and antiinflammatory activities. (I), or

XX vectors comprising nucleotide sequences encoding (I), are useful for

XX interfering with the replication or gene expression of HCV in a human

XX cell. (I) are useful for diagnosis, prevention and treatment of HCV

XX infection or disease in a mammals especially humans. Nucleotide sequences

XX encoding (I) are useful for preventing hepatitis C viral infection in a

XX cell. AAA13401 to AAA13405 represent examples of the briefest

XX requirements for hairpin ribozyme; AAA13406 and AAA13407 represent PCR

XX primers used in the amplification of the HCV capsid sequence; AAA13408 to

XX AAA13467 represent HCV hairpin ribozyme recognition sites; and AAA13468

XX to AAA13473 represent oligonucleotides used in the construction of HCV

XX hairpin ribozymes, all these sequences are used in the exemplification of

XX the present invention

XX New ribozyme having the ability to inhibit replication, infectivity or

XX gene expression of a Hepatitis C Virus (HCV), useful for treating or

XX preventing HCV infection.

XX Example 1; Col 12; 48pp; English.

XX The invention relates to a new ribozyme with the ability to inhibit

XX replication, infectivity or gene expression of a Hepatitis C Virus (HCV)

XX by cleaving the positive strand genomic RNA of HCV at a sequence having

XX 16 bp. Also included are a nucleic acid encoding the ribozyme, a host

XX cell containing the ribozyme or vector, a vector comprising a promoter

XX operably linked to the nucleic acid, producing a ribozyme, interfering

XX with HCV replication or gene expression in a cell infected in a cell

XX culture with HCV or a composition comprising the ribozyme and a carrier

XX or diluent. The ribozyme is useful for treating or preventing HCV

XX infection. The present sequence is an HCV -ve strand recognition sequence

XX for a ribozyme of the invention

PT Novel compound useful for treating cirrhosis, liver failure,  
 PT hepatocellular carcinoma, or condition associated with hepatitis C virus  
 PT infection.

PS Claim 1; Page 315; 387pp; English.

XX The present invention relates to nucleic acid molecules which modulate  
 CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or  
 CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense  
 CC and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,  
 CC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed  
 CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse  
 CC transcriptase and/or HBV reverse transcriptase primer sequences, as well  
 CC as oligonucleotides that specifically bind the Enhancer I region of HBV  
 CC DNA. The nucleic acids may be used to modulate the expression of HBV  
 CC genes and HBV viral replication. Also disclosed is a method for screening  
 CC compounds and/or potential therapies directed against HBV, and compounds  
 CC that modulate the expression and/or replication of HCV. The compounds and

CC methods of the invention are useful for the treatment of degenerative and  
 CC disease states related to HBV and HCV infection, replication and gene  
 CC expression such as cirrhosis, liver failure, and hepatocellular  
 CC carcinoma. The present sequence represents a substrate for one of the HCV  
 CC DNAzyme or minus strand DNAzyme sequences disclosed in the present  
 CC invention

 PT carcinoma.  
 PT  
 XX Claim 19; Page 32; 100pp; English.  
 PS  
 XX The sequences given in AAT80211-382 represent synthetic oligonucleotides  
 CC which are complementary to a portion of the 5' untranslated region (UTR)  
 CC of hepatitis C virus (HCV). These sequences may be used in a  
 CC pharmaceutical composition for the control or prevention of HCV  
 CC infection. They may be used to inhibit replication or expression of HCV  
 CC or for detecting the presence of HCV in a sample. They may be used to  
 CC inhibit HCV replication in a cell and are therefore useful in the

CC treatment of HCV infections such as chronic and acute hepatitis and  
CC hepatocarcinoma. This oligo was used in a luciferase assay to determine  
CC whether it binds successfully to its target

CC The sequences given in AAT80211-382 represent synthetic oligonucleotides  
CC which are complementary to a portion of the 5' untranslated region (UTR)  
CC of hepatitis C virus (HCV). These sequences may be used in a  
CC pharmaceutical composition for the control or prevention of HCV  
CC infection. They may be used to inhibit replication or expression of HCV  
CC or for detecting the presence of HCV in a sample. They may be used to  
CC inhibit HCV replication in a cell and are therefore useful in the  
CC treatment of HCV infections such as chronic and acute hepatitis and  
CC hepatocarcinoma. This oligo was used in a luciferase assay to determine  
CC whether it binds successfully to its target

```

XX PS Claim 22; Page 10; 74pp; English.

XX CC The invention describes synthetic oligonucleotides complementary to a

XX CC portion of the 5' untranslated region of hepatitis C virus. The

XX CC oligonucleotides may be used in methods for controlling, preventing, and

XX CC treating hepatitis C virus infection, in antisense technology and gene

XX CC therapy, and of detecting the presence of hepatitis C virus in a sample.

XX CC Hepatitis C virus (HCV) is an enveloped, positive sense, single-stranded

XX CC RNA virus which infects hepatocytes. HCV is the major cause of non-A, non

XX CC -B, acute and chronic hepatitis, and has been associated with

XX CC hepatocellular carcinoma. The invention describes methods and kits for

XX CC inhibiting replication of HCV, inhibiting the expression of HCV nucleic

XX CC acid and protein, and for treating HCV infections. This sequence

XX CC represents a synthetic DNA-RNA hybrid oligonucleotide used for inhibiting

XX CC HCV replication and expression of HCV

CC The invention describes synthetic oligonucleotides complementary to a  
CC portion of the 5' untranslated region of hepatitis C virus. The  
CC oligonucleotides may be used in methods for controlling, preventing, and  
CC treating hepatitis C virus infection, in antisense technology and gene  
CC therapy, and of detecting the presence of hepatitis C virus in a sample.  
CC Hepatitis C virus (HCV) is an enveloped, positive sense, single-stranded  
CC RNA virus which infects hepatocytes. HCV is the major cause of non-A, non  
CC -B, acute and chronic hepatitis, and has been associated with  
CC hepatocellular carcinoma. The invention describes methods and kits for

CC inhibiting replication of HCV, inhibiting the expression of HCV nucleic acid and protein, and for treating HCV infections. This sequence  
CC represents a synthetic DNA-RNA hybrid oligonucleotide used for inhibiting  
CC HCV replication and expression of HCV

XX      treating HCV infections and hepatocellular carcinoma.
XX      PS
XX      Claim 23; Page 7; 74pp; English.
XX      CC
XX      The invention describes synthetic oligonucleotides complementary to a
XX      portion of the 5' untranslated region of hepatitis C virus. The
XX      oligonucleotides may be used in methods for controlling, preventing, and
XX      treating hepatitis C virus infection, in antisense technology and gene
XX      therapy, and of detecting the presence of hepatitis C virus in a sample.
XX      Hepatitis C virus (HCV) is an enveloped, positive sense, single-stranded
XX      RNA virus which infects hepatocytes. HCV is the major cause of non-A, non
XX      -B, acute and chronic hepatitis, and has been associated with
XX      hepatocellular carcinoma. The invention describes methods and kits for
XX      inhibiting replication of HCV, inhibiting the expression of HCV nucleic
XX      acid and protein, and for treating HCV infections. This sequence
XX      CC
XX      represents a synthetic DNA-RNA hybrid oligonucleotide used for inhibiting
XX      HCV replication and expression of HCV

PS Disclosure; Page 13; 65pp; English.  
XX  
CC AA299212-26 represent PCR primers used in a primer-specific and mispair  
CC extension assay (PSMEA) for genotype determination of Hepatitis C virus  
CC (HCV). The method comprises extending an unknown nucleic acid sequence  
CC (from a patient) using a primer specific for particular genotype and  
CC incomplete set of dNTPs under suitable conditions followed by  
CC characterizing and comparing the extension products with known nucleic  
CC acid sequences of various genotypes. The present primers are used for  
CC detecting nucleotide variations in the 5' untranslated region of the HCV  
CC genome. PSMEA is capable of accurately detecting heterozygotes and  
CC nucleotide mutations in a nucleic acid sequence. The PSMEA is useful for  
CC identifying gene variations such as in different genotypes or subtypes  
CC a given genotype, especially Hepatitis C virus genotypes and subtypes

PS Example 3; SEQ ID NO 1162; 183pp; English.  
XX  
CC This invention relates to novel double-stranded short interfering nucleic  
CC acids (siRNA) that inhibits replication of hepatitis C virus (HCV), where  
CC one strand is an antisense strand (ASS) that is complementary to (part  
CC of) an HCV RNA (portion) and a sense strand (SS) that is complementary  
CC ASS, and where most of the pyrimidine nucleotides comprise a sugar  
CC modification. The invention may allow development of compounds with  
CC virucide, antiinflammatory, hepatotropic or cytostatic activities by  
CC modulation (inhibition) of expression or activity of HCV RNA. By RNA  
CC interference. The siRNA's of the invention may be used to inhibit  
CC replication of HCV, in cells, tissue explants or organisms, for treating  
CC HCV infection and its consequences (liver failure; hepatocellular cancer  
CC and cirrhosis), and also for drug screening, diagnosis, target  
CC identification and validation, genetic engineering, pharmacogenomics,  
CC studying gene function and gene mapping (for example of single-nucleotide  
CC polymorphisms). The chemical modification improves stability, activity,  
CC cellular uptake and/or binding affinity. The siRNA can be directed to  
CC conserved regions of HCV genes, so are active against many different  
CC strains.

 PT virus.  
 XX  
 PS Example 3; SEQ ID NO 1234; 183bp; English.  
 XX

This invention relates to novel double-stranded short interfering nucleic acid (siRNA) that inhibits replication of hepatitis C virus (HCV), where one strand is an antisense strand (ASS) that is complementary to (part of) an HCV RNA (portion) and a sense strand (SS) that is complementary to ASS, and where most of the pyrimidine nucleotides comprise a sugar virucide, antiinflammatory, hepatotropic or cytosstatic activities by modulation (inhibition) of expression or activity of HCV RNA, by RNA interference. The siRNA's of the invention may be used to inhibit replication of HCV, in cells, tissue explants or organisms, for treating HCV infection and its consequences (liver failure; hepatocellular cancer and cirrhosis), and also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (for example of single-nucleotide polymorphisms). The chemical modification improves stability, activity, cellular uptake and/or binding affinity. The siRNA can be directed to conserved regions of HCV genes, so are active against many different

CC strains.

PS This invention relates to novel double-stranded short interfering nucleic  
CC acids (siNA) that inhibits replication of hepatitis C virus (HCV), where  
CC one strand is an antisense strand (ASS) that is complementary to (part

CC of) an HCV RNA (portion) and a sense strand (SS) that is complementary to  
CC ASS, and where most of the pyrimidine nucleotides comprise a sugar  
CC modification. The invention may allow development of compounds with  
CC virucide, antiinflammatory, hepatotropic or cytostatic activities by  
CC modulation (inhibition) of expression or activity of HCV RNA, by RNA  
CC interference. The siRNA's of the invention may be used to inhibit  
CC replication of HCV, in cells, tissue explants or organisms, for treating  
CC HCV infection and its consequences (liver failure, hepatocellular cancer  
CC and cirrhosis), and also for drug screening, diagnosis, target  
CC identification and validation, genetic engineering, pharmacogenomics,  
CC studying gene function and gene mapping (for example of single-nucleotide  
CC polymorphisms). The chemical modification improves stability, activity,  
CC cellular uptake and/or binding affinity. The siRNA can be directed to  
CC conserved regions of HCV genes, so are active against many different  
CC strains.

PT Capture oligonucleotide composition useful for detection of hepatitis B  
 PT virus (HBV), comprising polynucleotide having HBV-complementary sequence  
 PT which is immobilized on solid support.  
 XX Example 7; SEQ ID NO 121; 112bp; English.

XX The invention relates to a capture oligonucleotide composition comprising  
 CC an hepatitis B virus (HBV)-complementary sequence polynucleotide  
 CC immobilised to a solid support. The composition is useful for detecting  
 CC nucleic acids of HBV and/of HIV-1 and/or HCV in biological sample such as

CC blood, serum, plasma or other body fluid or tissue to be tested. The  
 CC composition can be used either in diagnostic application or for screening  
 CC donated blood and that products or other tissues that may contain  
 CC infectious particles. The composition facilitates detection of very low  
 CC levels of HBV nucleic acids. The composition allows selective detection  
 CC of nucleic acids of HBV and/or HIV and/or HCV. The present sequence is  
 CC used in the exemplification of the invention.

 PT Interference RNA agent useful for treating dyslipidemia; coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.

PS Example 5; SEQ ID NO 5721; 378bp; English.

XX  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (MI) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidemia, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a hepatitis C virus (HCV) antisense oligonucleotide that can  
 CC be used to control HCV gene expression.

 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (II): reducing (MI) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilizing (I); involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (MI)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterized by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a hepatitis C virus (HCV) antisense oligonucleotide that can  
 CC be used to control HCV gene expression.

 XX  
 CC RNA was extracted from the serum of an HCV-positive blood donor, subjected  
 CC to reverse transcription and the cDNA formed amplified by PCR.  
 CC Amplification products were cloned, screened with a probe derived from the  
 CC HCV prototype and inserts sequenced. The results showed marked  
 CC conservation in the non-coding region, significant variability in the  
 CC structural region (encoding envelope proteins) and reduced variability in  
 CC the non-structural region. The primer and probe sequences and positions  
 CC correspond to the HCV prototype (HCV pt) (EP-A-O 318 216 and WO-A-  
 CC 90/14436). (Updated on 25-MAR-2003 to correct PN field.)

XX
XX Antisense oligonucleotides were synthesised which are complementary to
CC target sequences located at 10-nucleotide intervals from nucleotide 1 to
CC 339 in the HCV RNA 5'-untranslated region. Of these sequences (CAS-1 to
CC CAS-320), oligonucleotide CAS-110 (AA058403), which is complementary to a
CC portion of loop C, was found to cause greater than 80% inhibition of core
CC protein translation. Antisense oligonucleotides which are complementary
CC to the 26 base region from nucleotides 104-129 of HCV RNA showed strong
CC inhibitory activity compared to oligonucleotides complementary to other
CC regions of the 5'-UTR. The oligonucleotides CAS-104, -106 and -108 showed
CC 70% or more inhibition of HCV translation. See AA058388-Q58422, AA044885-
CC Q44892 and AA058383. (Updated on 25-MAR-2003 to correct PN field.)

CC Antisense oligonucleotides were synthesised which are complementary to

CC target sequences located at 10-nucleotide intervals from nucleotide 1 to  
CC 339 in the HCV RNA 5'-untranslated region. Of these sequences (CAS-1 to  
CC CAS-320), oligonucleotide CAS-110 (AAQ58403), which is complementary to a  
CC portion of loop C, was found to cause greater than 80% inhibition of core  
CC protein translation. Antisense oligonucleotides which are complementary  
CC to the 26 base region from nucleotides 104-129 of HCV RNA showed strong  
CC inhibitory activity compared to oligonucleotides complementary to other  
CC regions of the 5'-UTR. The oligonucleotides CAS-104, -106 and -108 showed  
CC 70% or more inhibition of HCV translation. See AAQ58388-Q58422, AAQ44885-  
CC Q44892 and AAQ58383. (Updated on 25-MAR-2003 to correct PN field.)

PT Replication of hepatitis C virus in non-lymphoblastoid mammalian cells -

PT useful for studies of HCV replication, prodn. of vaccines or viral

PT antigens, etc.

PS Disclosure; Page 8; 25pp; English.

CC Hepatitis C virus can be replicated in non-lymphoblastoid mammalian cells

CC by first incubating an HCV sample with the cells until an infecting

CC amount of HCV has been absorbed. Infected cells are then washed and

CC incubated under growth conditions. In an example, the presence of HCV in

CC culture medium of monkey kidney cells inoculated with HCV-infected serum

CC was verified by PCR amplification using two external primers (OU1 and

CC OU2, see AAT39731 and AAT39732) and two internal primers (IN1 and IN2,

CC see AAT39733 and AAT39734). The amplified products were identified by

CC hybridisation to labelled probe SI (see AAT39735). Small amounts of virus

CC were shown to be released into the culture medium from secondary

CC cultures. Control (non-inoculated) cells were negative for presence of

CC viral genome

XX Hepatitis C virus RNA-binding single-stranded oligo DNAs useful as  
XX reagents for gene diagnosis involving cleavage, amplification and  
XX detection of RNA and as an inhibitory drugs.  
XX  
XX Claim 3; Page 12; 21pp; English.  
XX  
XX The invention relates to single-stranded antisense oligodeoxynucleotides  
XX (AAx52563-A52568) which bind to various sites on the hepatitis C virus  
XX (HCV) RNA genome, and to sense oligodeoxynucleotides (AAx52569-A52571)  
XX corresponding to sites on the HCV genome. The oligonucleotides are useful  
XX as primers in RT-PCR (reverse transcription-PCR) and the sense  
XX oligonucleotides may also be used as promoter primers. The antisense  
XX oligonucleotides may be used to inhibit translation or reverse  
XX transcription of HCV RNA and may be used as probes for detection of HCV  
XX RNA. Additionally, the antisense oligos may be linked to an RNA-cleaving  
XX cleavage. The invention also encompasses methods of identifying and  
XX preparing single-stranded oligodeoxynucleotides which bind to target  
XX RNAs. The single-stranded oligodeoxynucleotides are useful as reagents  
XX for genetic diagnosis involving cleavage, amplification and detection of  
XX HCV RNA (as primers and probes), and as inhibitors of reverse  
XX transcription or translation of HCV RNA. Sequences AAx52563-A52568  
XX represent the antisense oligodeoxynucleotides of the invention. The  
XX present sequence is complementary to bases 97-116 of HCV genomic RNA

DR Hepatitis C virus RNA-binding single-stranded oligo DNAs useful as

PT reagents for gene diagnosis involving cleavage, amplification and

PT detection of RNA and as an inhibitory drugs.

XX Claim 4; Page 13; 21pp; English.

XX The invention relates to single-stranded antisense oligodeoxynucleotides

CC (AAA52563-A52568) which bind to various sites on the hepatitis C virus

CC (HCV) RNA genome, and to sense oligodeoxynucleotides (AAA52569-A52571)

CC corresponding to sites on the HCV genome. The oligonucleotides are useful

CC as primers in RT-PCR (reverse transcription-PCR) and the sense

CC oligonucleotides may also be used as promoter primers. The antisense

CC oligonucleotides may be used to inhibit translation or reverse

CC transcription of HCV RNA and may be used as probes for detection of HCV

CC RNA. Additionally, the antisense oligos may be linked to an RNA-cleaving

CC moiety to target single-stranded RNA cleavage or RNA heteroduplex

CC cleavage. The invention also encompasses methods of identifying and

CC preparing single-stranded oligodeoxynucleotides which bind to target

CC RNAs. The single-stranded oligodeoxynucleotides are useful as reagents

CC for genetic diagnosis involving cleavage, amplification and detection of

CC HCV RNA (as primers and probes), and as inhibitors of reverse

CC transcription or translation of HCV RNA. Sequences AAA42563-A52568

CC represent the antisense oligodeoxynucleotides of the invention. The

CC present sequence is complementary to bases 95-114 of HCV genomic RNA

XX PT Identifying a viral replication inhibitor comprises contacting nucleic acids from a virus infected host with an amplification mixture of two primers and/or probes that provide detectable signals during a polymerase chain reaction.

XX PS Example 16; Page 36; 95pp; English.

XX CC This invention relates to a novel method for identifying an inhibitor of viral replication by contacting nucleic acids from a virus infected host with an amplification mixture having 2 primers and/or probes that provide detectable signals during a polymerase chain reaction. The method of the invention is useful for identifying a compound that inhibits viral replication. Another new method is useful for assessing the toxicity of an anti-viral compound. The method of the invention is economic, non-radioactive, rapid, accurate, reproducible and amenable to large throughput. The second method of the invention is a sensitive and accurate method for determining mitochondrial toxicity of a compound. The present sequence represents a hepatitis C virus (HCV) real time PCR probe used in the method of the invention

XX PT Producing DNA encoding restriction endonuclease with altered specificity, comprises mutagenizing DNA encoding the enzyme and isolating DNA encoding mutated enzyme with specificity for an altered sequence.

XX PS Example; Page 5; 44pp; English.

XX CC The invention relates to a method of producing a polynucleotide encoding a restriction endonuclease with altered specificity. The method involves mutagenizing a polynucleotide encoding restriction endonuclease with specificity for a recognition sequence to produce mutated polynucleotides and isolating from them a polynucleotide encoding mutated restriction endonuclease with specificity for an altered recognition sequence by selecting a polynucleotide expressing a restriction endonuclease with methylase specificity for the altered recognition sequence. The method is useful for producing a polynucleotide encoding a restriction endonuclease comprising Eco571, BcgI, HaeIII or AclI, with an altered specificity. The method allows selection of mutant variants recognising new sequences that differ not only in single nucleotide from wild type enzyme but also for mutants that recognise degenerate sequences or sequences differing in several nucleotides, especially if mutants of altered specificity are taken into the next round of mutagenesis and digestion-selection. The present sequence is recognition sequence of GsuI restriction enzyme

PT Synthetic oligonucleotides complementary to a portion of the 5'  
PT untranslated region of hepatitis C virus (HCV), useful for diagnosing and  
PT treating HCV infections and hepatocellular carcinoma.  
XX  
PS Disclosure; Page 8; 74pp; English.  
XX  
CC The invention describes synthetic oligonucleotides complementary to a  
CC portion of the 5' untranslated region of hepatitis C virus. The  
CC oligonucleotides may be used in methods for controlling, preventing, and  
CC treating hepatitis C virus infection, in antisense technology and gene  
CC therapy, and of detecting the presence of hepatitis C virus in a sample.  
CC Hepatitis C virus (HCV) is an enveloped, positive sense, single-stranded  
CC RNA virus which infects hepatocytes. HCV is the major cause of non-A, non  
CC -B, acute and chronic hepatitis, and has been associated with  
CC hepatocellular carcinoma. The invention describes methods and kits for  
CC inhibiting replication of HCV, inhibiting the expression of HCV nucleic  
CC acid and protein, and for treating HCV infections. This sequence  
CC represents a synthetic oligonucleotide used for inhibiting HCV  
CC replication and expression of HCV

XX Structure and usage of antisense oligonucleotide for treating diseases
XX correlative to hepatitis C virus.
XX
XX
XX Claim 1; Page 1; 20pp; Chinese.
XX
XX
XX The present invention describes antisense oligonucleotides which are
XX designed and synthesised on the basis of the gene structure of hepatitis
XX C virus (HCV) and can be used to suppress the expression of HCV gene. The
XX non-coding region 5' of HCV gene is used to regulate the instantaneous
XX expression system of leuciferinase gene in HepG2 cells and the transgenic
XX cell model HepG2.9706 of luciferase gene. The 15 antisense
XX oligonucleotides (AAV2988 to AAA73002) which are complementary to the
XX non-coding region 5' and translational initiation region of HCV are
XX actively screened and evaluated to discover for the first time the
XX oligonucleotides HCV279, HCV349, HCV363, HCV65 and HCV 313 and their
XX chemical modified objects for suppressing the expression of HCV gene.
XX Thus, the present invention relates to the new medicine for treating the
XX diseases associated with HCV

XX Identifying a compound that inhibits replication of a hepatitis C virus
PT (HCV) RNA comprises contacting a cell comprising a replication competent
PT HCV RNA containing a heterologous polynucleotide encoding a
PT transactivator, with a compound.
XX
XX Example 2; SEQ ID NO 7; 95pp; English.
XX
CC The invention describes a method of identifying a compound that inhibits
CC replication of a hepatitis C virus (HCV) RNA. The method comprises
CC contacting a cell comprising a replication competent HCV RNA containing a
CC heterologous polynucleotide having a first coding sequence encoding a
CC transactivator, with a compound. The method is useful for identifying a
CC compound that inhibits replication of HCV RNA. The kit is useful for
CC detecting replication competent HCV RNA. This sequence represents a probe
CC used to detect DNA encoding HCV in order to detect the production of the
CC virus by chimpanzee.

XX
XX Novel replication competent hepatitis C virus for producing infectious
PT viral particles and as antigen for detecting hepatitis C virus
PT antibodies, comprises hepatitis C virus genome and heterologous
PT polynucleotide.
XX
XX Example 2; Page 12; 37pp; English.
XX
XX The invention discloses a replication competent hepatitis C virus (HCV)
CC comprising a HCV virus genome and a heterologous polynucleotide, where
CC the HCV genome comprises a 3' non-translated RNA and the heterologous
CC polynucleotide is present in the 3' non-translated RNA. HCV is a cause of
CC chronic viral hepatitis, hepatic fibrosis, cirrhosis and/or the
CC development of hepatocellular carcinoma. A cell comprising the HCV is
CC useful for selecting or detecting a replication competent HCV, for
CC identifying a compound that inhibits replication of HCV, for producing
CC infectious viral particles which are useful as a source of virus
CC particles for various assays, including evaluating methods for
CC inactivating particles, excluding particles from serum, identifying a
CC neutralizing compound and as an antigen for use in detecting anti-HCV
CC antibodies in an animal. The cell comprising the HCV is also useful for
CC identifying a variant HCV. An HCV particle is useful as an antigen, as a
CC positive-control in assays that test for the presence of anti-HCV
CC antibodies, to produce antibodies to detect the presence of viral
CC particles in biological samples (e.g. blood products and cell-free blood
CC products) and as a source of viral antigen to measure the presence and
CC amount of antibody present in an animal. The sequence presented is the
CC Light Cycler PCR red probe which was used to detect HCV

Producing DNA encoding restriction endonuclease with altered specificity;

comprises mutagenizing DNA encoding the enzyme and isolating DNA encoding

mutated enzyme with specificity for an altered sequence.

Example; Page 5; 44pp; English.

The invention relates to a method of producing a polynucleotide encoding

a restriction endonuclease with altered specificity. The method involves

mutagenizing a polynucleotide encoding restriction endonuclease with

specificity for a recognition sequence to produce mutated polynucleotides

and isolating from them a polynucleotide encoding mutated restriction

endonuclease with specificity for an altered recognition sequence by

selecting a polynucleotide expressing a restriction endonuclease with

methylester specificity for the altered recognition sequence. The method is

useful for producing a polynucleotide encoding a restriction endonuclease

comprising Eco571, BspI, HaeIII or AclI, with an altered specificity. The

method allows selection of mutant variants recognising new sequences that

differ not only in single nucleotide from wild type enzyme but also for

several nucleotides, especially if mutants of altered specificity are

taken into the next round of mutagenesis and digestion-selection. The

present sequence is recognition sequence of Gaui restriction enzyme

Ladner RC, Cohen EH, Natri HG, Rooker KL, Hoet R;

WPI; 2002-011131/01.

Selective cleavage of single-stranded nucleic acid, useful for preparing

display libraries of proteins and peptides, by hybridization with

oligonucleotide and enzymatic restriction.

Disclosure; SEQ ID NO 223; 190pp; English.

The invention relates to a method of cleaving single-stranded (ss)

nucleic acid (I) at a selected location, using an oligonucleotide (ON)

that is complementary to (I) in the target region and a restriction

endonuclease (RE). The ON forms, with its complement in (I), an RE

recognition site that ensures cleavage only at the selected location.

Contact between (I) and ON, and treatment with RE, are done at a

temperature at which (I) (I) is maintained in substantially ss form and

(II) RE is active. ON is (i) single stranded, and includes a sequence

that forms, with its complement in (I), the RE site or (ii) has a double-

stranded (ds) region that includes a recognition site for a type IIS RE

that cleaves at a remote site formed by complementation of (I) and the ss

region of ON. The method is used to construct libraries of genetic

packages (phages) that display diverse families of (poly)peptides and

proteins (A), especially human Fab or other antibody fragments. The

libraries are screened to identify (A) for possible therapeutic use. The

method is not biased to DNAs containing native sequences complementary to

amplification primers and allows any sequences that may be deleterious to

expression to be removed before cloning and display. DNAs are cut only at

a single (constant) site, without the need to build an RE site into the

or synthetic site can be used for cleavage. The use of a partially ds ON

allows cleavage at sites where no restriction sites occur naturally or

can be created. Both methods allow use of 5' and 3' primers for maximum

diversity. This sequence represents a sequence used in the invention.

PT Detecting presence of target nucleic acid molecule e.g. human

PT immunodeficiency virus, hepatitis B or C virus in a sample, by using a

PT universal multi-variant detection system.

XX

PS Example; Page 25; 63pp; English.

XX

CC The invention relates to a novel method for a primer extension chain

CC reaction for determining presence of a target nucleic acid molecule in a

CC sample, where the nucleotide at 3' end of the reverse primer hybridises

CC with nucleotide at 5' end of the forward primer extension product or a

CC nucleotide separated from the nucleotide at 5' end of the forward primer

CC extension product by a gap comprising a highly conserved nucleotide

CC sequence. The method is useful for determining presence of a target

CC nucleic acid molecule known to have variant sequences, in a sample. The

CC target nucleic acid is preferably a virus including human

CC immunodeficiency virus (HIV), hepatitis C virus (HCV), hepatitis B virus

CC (HBV) or Parvovirus B19. This polynucleotide sequence represents a PCR

CC primer used in the primer extension chain reaction method of the

CC invention

 PT Cleaving single-stranded nucleic acid sequences at a desired location by  
 PT contacting the nucleic acid with an single strand oligonucleotide  
 PT complementary to a nucleic acid region where cleavage is desired.  
 XX  
 XX  
 PS Disclosure; Page 370; 485bp; English.  
 XX  
 XX The present invention describes a method for cleaving single-stranded  
 CC nucleic acid sequences at a desired location. Also described: (1) methods  
 CC for displaying or expressing a member of a diverse family of peptides,  
 CC polypeptides or proteins on the surface of a genetic package and  
 CC collectively displaying at least a part of the diversity of the family,  
 CC where the displayed or expressed peptide, polypeptide or protein is  
 CC encoded at least in part by a nucleic acid that has been cleaved at a  
 CC desired location; (2) a method for preparing single-stranded nucleic  
 CC acids; (3) a method for preparing a library comprising a collection of  
 CC genetic packages that display a member of a diverse family of peptides,  
 CC polypeptides or proteins and that collectively display at least a portion  
 CC of the family; (4) a vector comprising a DNA sequence encoding an  
 CC antibody variable region linked to a version of pIII anchor which does  
 CC not mediate infection of phage particles, and wild-type gene III; (5) a  
 CC method for producing a population or a library of immunoglobulin genes;  
 CC and (6) a library of immunoglobulins that comprise members having at  
 CC least one variable domain in which at least one of CDR1 and CDR2 contain  
 CC synthetic diversity and CDR3 diversity is captured from B cells. The  
 CC method is useful for cleaving single-stranded nucleic acid sequences at a  
 CC desired location, which can be subsequently used to produce libraries or  
 CC genetic packages that display and/or express a diverse family of  
 CC peptides, polypeptides or proteins. AB236912 to AB237510 and ABP5564 to  
 CC ABP55499 represent sequences used in the exemplification of the present  
 CC invention

PT Obtaining single stranded polynucleotide tags from a biological sample,  
PT for analyzing gene expression or diagnosing clinical conditions,  
PT comprises employing nicking endonucleases that cleave complementary  
PT strands.

XX PS Disclosure; Page 88; 302pp; English.

CC The invention relates to a method for obtaining a single stranded  
CC polynucleotide tag from a biological sample by cleaving one of the  
CC complementary strands of a double stranded polynucleotide with a cleavage  
CC agent capable of recognising a double stranded polynucleotide comprising  
CC complementary strands and cleaving only one of the strands of the  
CC polynucleotide in the process of generating a single stranded  
CC polynucleotide tag. The method is useful for separating, analyzing,  
CC quantifying or obtaining single stranded polynucleotides comprising tags  
CC originating partly, and preferably wholly from a source of DNA and/or RNA  
CC in a sample comprising biological cells. The method is particularly for  
CC analyzing gene expression (expression profiling or differential gene  
CC expression), or in diagnosing clinical conditions. The present sequence  
CC is Bpm I restriction endonuclease recognition motif. This sequence is  
CC used to illustrate the method of the invention

PT Hepatitis C virus (HCV) anti:sense RNA - inhibits HCV structural gene  
PT expression in vivo for treatment of HCV infection.  
XX  
PS Example 1; Page 4; 12pp; Japanese.  
XX  
CC The present sequence is that of amplification primer AS33 which was used  
CC for amplifying partial 5'-UTR sequences from the HCV genome. Clone 2-1  
CC (Journal of Virology: 66, 1476-1483 (1992)) was used as the template for  
CC PCR. The amplified fragments were transcribed to produce antisense RNA  
CC which is useful for inhibiting expression of HCV structural genes and  
CC thereby inhibiting viral replication in vivo. The antisense therapy can  
CC be used in addition to conventional interferon treatment of HCV  
CC infections

XX	Oligo:nucleotide(s) complementary to HCV 5' untranslated region - used in
PT	the treatment and detection of HCV infection, esp. hepatitis and hepato-
PT	carcinoma.
XX	
PS	Claim 21; Page 21; 100pp; English.
XX	
CC	The sequences given in AAT80211-382 represent synthetic oligonucleotides
CC	which are complementary to a portion of the 5' untranslated region (UTR)
CC	of hepatitis C virus (HCV). These sequences may be used in a
CC	pharmaceutical composition for the control or prevention of HCV
CC	infection. They may be used to inhibit replication or expression of HCV
CC	or for detecting the presence of HCV in a sample. They may be used to
CC	inhibit HCV replication in a cell and are therefore useful in the
CC	treatment of HCV infections such as chronic and acute hepatitis and
CC	hepatocarcinoma. This sequence binds to three non-contiguous regions of
CC	the HCV genome. This sequence is targeted to the 5' target region, +1 to
CC	+6, the internal sequence target, -230 to -219 and the 3' target region,
CC	+235 to +240

XX	
CC	The sequences given in AAT80211-382 represent synthetic oligonucleotides
CC	which are complementary to a portion of the 5' untranslated region (UTR)
CC	of hepatitis C virus (HCV). These sequences may be used in a
CC	pharmaceutical composition for the control or prevention of HCV
CC	infection. They may be used to inhibit replication or expression of HCV
CC	or for detecting the presence of HCV in a sample. They may be used to
CC	inhibit HCV replication in a cell and are therefore useful in the
CC	treatment of HCV infections such as chronic and acute hepatitis and
CC	hepatocarcinoma. This oligo was used in a luciferase assay to determine
CC	whether it binds successfully to its target

 Clones are derived from the bovine BAC library CHORI-240  
 (<http://www.chori.org/bacpac/bovine240.htm>).  
 Bases shown have phred quality value equal to or higher than 20.  
 For BAC library availability, please contact Pieter de Jong  
 (pdejong@mail.cho.org).  
 Clones may be purchased from BACPAC Resources  
 (<http://www.chori.org/bacpac/ordering/information.htm>).  
 This work was undertaken as part of the International Bovine BAC Mapping Consortium (IBBMC) by Embrapa Recursos Geneticos e Biotecnologia with financing from Conselho Nacional de Desenvolvimento Cientifico e tecnologico (CNPq), Brazil

End sequencing of clones from the Felis catus RPCI-86 Male Feline BAC library was performed at the Laboratory of Comparative Cancer Genomics at the University of Minnesota. Clone plates 620 through 624 of the RPCI-86 BAC library (prepared at the Children's Hospital Oakland Research Institute) were provided by the Laboratory of Genomic Diversity, National Cancer Institute. All sequencing reactions were run at the Advanced Genetic Analysis Center (<http://www.agac.umn.edu>) and the results processed through an automated pipeline 'biodata' at the Center for Computational Genomics and Bioinformatics at the University of Minnesota. Vector sequences were screened and the BAC-end sequences were trimmed to phred quality scores above 20 as described (<http://web.ahc.umn.edu/biodata/catbac/>). Vector and quality screened sequences > 150 nt in length are submitted.

 Clones are derived from the bovine BAC library CHORI-240  
 (http://www.chori.org/bacpac/bovine240.htm).  
 Bases shown have phased quality value equal to or higher than 20.  
 Bases with quality value below 20 were masked with 'N'.  
 For BAC library availability, please contact Pieter de Jong  
 (pjejong@mail.cho.org).  
 Clones may be purchased from BACPAC Resources  
 (http://www.chori.org/bacpac/ordering\_information.htm).  
 This work was undertaken as part of the International Bovine BAC  
 Mapping Consortium (IBMC) by Embrapa Recursos Geneticos e  
 Biotecnologia with financing from Conselho Nacional de  
 Desenvolvimento Cientifico e Tecnologico (CNPq), Brazil

 Clones are derived from the bovine BAC library CHORI-240  
 (http://www.choi.org/bacpac/ordering/information.htm).  
 Bases shown have phred quality value equal to or higher than 20.  
 Bases with quality value below 20 were masked with 'N'.  
 For BAC library availability, please contact Pieter de Jong (pjejong@mail.cho.org).  
 Clones may be purchased from BACPAC Resources  
 (http://www.choi.org/bacpac/ordering/information.htm).  
 This work was undertaken as part of the International Bovine BAC Mapping Consortium (IBMC) by Embrapa Recursos Geneticos e Biotecnologia with financing from Conselho Nacional de Desenvolvimento Cientifico e Tecnologico (CNPq), Brazil

 NotI; Mouse cDNA project by the Laboratory of Genetics,  
 National Institute on Aging (NIA), Intramural Research  
 Program, NIH (http://igun.grc.nia.nih.gov/cDNA). This is  
 a short-transcript enriched cDNA library (Ref. Genome Res.  
 11: 1553-1558 (2001). [PMID: 11544199]). In brief,  
 double-stranded cDNAs were synthesized with an Oligo (dT)  
 primer (Invitrogen: 5'-  
 pGACTACTTCAGATCGGAGCGCCCTTTT-3') from 26  
 ug of total RNA, created with T4 DNA polymerase, and  
 purified by ethanol-precipitation. The cDNAs were ligated  
 to lone-linker L1-SalI, purified by phenol/chloroform, and  
 separated from free linkers by Centricon 100. Then, the  
 cDNAs were amplified by long-range high fidelity PCR using  
 Ex Taq polymerase (Takara) with a primer SalI-L. The  
 products were purified by phenol/chloroform and Centricon  
 100. The cDNAs were digested with SalI and NotI enzymes  
 and cloned into SalI/NotI site of pSPORT1 plasmid vector.  
 The DH10B E. coli host was transformed with the ligation  
 mixture by the standard chemical method. The average  
 insert size is about 1.5 kb. The library was constructed  
 by Yulan Piao(NIA)."

/note="Site 1: SalI; Site 2: BamHI; cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. 1st strand cDNA was primed with a primer [5' GAGAGAGAGATCCAGAGCTCTTTTCTTTTCTTTT 3'], cDNA was prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. cDNA went through one round of normalization to Rot = 20.0 and subtraction to Rot = 459.0. Second strand cDNA was prepared with the primer adapter of sequence [5' GAGAGAGAGATCTTCGACTTATTAATAATATCCCCCCCCCC 3']. cDNA was cleaved with XhoI and BamHI. Vector: a modified pBluescript KS(+) after bulk excision from Lambda PUC I. -Retina RNA was provided by Stefano Guarnieri, Department of Neurobiology, Harvard Medical School, 220 Longwood Ave., Boston, MA 02115, USA, whose assistance we gratefully acknowledge."

This is a long-transcript enriched cDNA library (Ref. Genome Res. 11: 1553-1558 (2001). [PMID: 11544199]). Total RNAs were obtained from Dr. Mark G. Carter (NIH/NIA-IRP). B6 cells were cultured at 37. C, 5% CO2 in DMEM supplemented with 15% ES cell-qualified FBS, 0.1mM non-essential amino acids, 1 mM glutamine, penicillin/streptomycin, 1 mM sodium pyruvate, 0.1 mM beta-mercaptoethanol, and 1000000 units of LIF per liter. Double-stranded cDNAs were synthesized with an Oligo(dT) primer (Invitrogen):  
 5'-POACTAGTCTAGATCGGACGGCGCCCTTTT-3' from 2.5 ug of total RNA, treated with T4 DNA polymerase, and purified by ethanol-precipitation. The cDNAs were ligated to lone-linker LR-Sa14, purified by phenol/chloroform, and separated from free linkers by Centricon 100. Then, the cDNAs were amplified by long-range high fidelity PCR using Ex Tag polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/chloroform and Centricon 100. The cDNAs were digested with SalI and NotI enzymes and cloned into SalI/NotI site of pCMV-SPORT6 plasmid vector. The DH10B E. coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 4.0 kb. The library was constructed by Yulan Piao."

prepared by using trehalose thermo-activated reverse
transcriptase and subsequently enriched for full-length by
cap-trapper. Second strand cDNA was prepared with the
primer adapter of sequence [5',
GAGGAGAGATCTCCAGATTAAATTAATTAAATCCCCCCCCCCC 3'}. cDNA
was cloned into the XhoI and BamHI sites. Vector: a
modified pbluescript KS(+) after bulk excision from Lambda
phage I"

MEDLINE	4 (bases 1 to 210) Strizhov,N., Li,Y., Rosso,M.G. and Weisshaar,B. Direct Submission Submitted (31-MAR-2004) Weisshaar B., Max-Planck-Institut fuer Zuechtungsforchung, Carl-von-Linn-Weeg 10, Koeln, 50829, Germany. This sequence has been recovered from the left border of the T-DNA. It indicates an insertion close to or within gene AT3G23810. Details on the protocols used for generation of the sequence are described in References 1-3. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated 'GABI'. Information on line availability can be found at: <a href="http://www.mpiz-koeln.mpg.de/GABI-Kat/">http://www.mpiz-koeln.mpg.de/GABI-Kat/</a> .

 modified polylinker; Site\_1: EcoR I; Site\_2: Not I;  
 UT-E-C11 is a normalized cDNA library containing the  
 following tissue(s): RPE and Choroid. The library was  
 constructed according to Bonaldo, Lennon and Soares,  
 Genome Research, 6:791-806, 1996. First strand cDNA  
 synthesis was primed with an oligo-dT primer containing a  
 Not I site. Double stranded cDNA was ligated to an EcoR I  
 adaptor, digested with Not I, and cloned directionally  
 into pT73-Pac vector. The oligonucleotide used to prime  
 the synthesis of first-strand cDNA contains a library tag  
 sequence that is located between the Not I site and the  
 (dT)18 tail. The sequence tag for this library is ACCGA.  
 This library was created for the program, Gene Discovery  
 in the Visual System, supported by National Eye Institute  
 (NEI)."

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

Patent No. US20020069422A1  
GENERAL INFORMATION:  
APPLICANT: MAERTENS, GEERT; STUYVER, LIEVEN;  
APPLICANT: ROSSAU, RUDI; VAN HEUVERSWYN, HUGO  
TITLE OF INVENTION: PROCESS FOR TYPING OF HCV  
TITLE OF INVENTION: ISOLATES  
NUMBER OF SEQUENCES: 97  
CORRESPONDENCE ADDRESS:  
ADDRESSEE: BIERMAN & MUSERLIAN  
STREET: 600 THIRD AVENUE  
CITY: NEW YORK  
STATE: NEW YORK  
COUNTRY: USA  
ZIP: 10016  
COMPUTER READABLE FORM:  
MEDIUM TYPE: floppy disk  
COMPUTER: IBM PC compatible  
OPERATING SYSTEM: PC-DOS/MS-DOS  
SOFTWARE: ASCII  
CURRENT APPLICATION DATA:  
APPLICATION NUMBER: US/09/294,121A  
FILING DATE:  
CLASSIFICATION:  
PRIOR APPLICATION DATA:  
APPLICATION NUMBER: 08/256,568  
FILING DATE: 18-JUL-1994  
APPLICATION NUMBER: PCT/EP93/03325  
FILING DATE: 26-NOV-1993  
PRIOR APPLICATION DATA:  
APPLICATION NUMBER: EP/93/402,129.6  
FILING DATE: 31-AUG-1993  
PRIOR APPLICATION DATA:  
APPLICATION NUMBER: EP/92/403,222.0  
FILING DATE: 27-NOV-1992  
ATTORNEY/AGENT INFORMATION:  
NAME: CHARLES A. MUSERLIAN  
REGISTRATION NUMBER: 19,683  
REFERENCE/DOCKET NUMBER: 410.004  
TELECOMMUNICATION INFORMATION:  
TELEPHONE: (212) 661-8000  
TELEFAX: (212) 661-8002  
INFORMATION FOR SEQ ID NO: 77:  
SEQUENCE CHARACTERISTICS:  
LENGTH: 177 base pairs  
TYPE: nucleic acid

STRANDEDNESS: single  
TOPOLOGY: linear  
MOLECULE TYPE: cDNA  
IMMEDIATE SOURCE:  
LIBRARY: be97  
POSITION IN GENOME:  
MAP POSITION: 5' untranslated region  
US-09-294-121A-77

Query Match 66.7%; Score 12; DB 9; Length 177;  
Best Local Similarity 83.3%; Pred. No. 7.2e+02;  
Matches 10; Conservative 2; Mismatches 0; Indels 0; Gaps 0;
